Secant Method

To find a root of an equation using secant method in given number of iterations.

(1) Find a real root of the equation $f(x) = x^3 - 5x + 1 = 0$ using secant method in six iterations.

```
In[ ]:= Secant[x0_, x1_, n_, f_] := Module[{xk, xk1, xk2}, xk = N[x0];
  xk1 = N[x1];
  i = 0;
  Output = { };
  While[i < n, xk2 = (xk * f[xk1] - xk1 * f[xk]) / (f[xk1] - f[xk]);
    interval = "[" <> ToString[NumberForm[xk, 12]] <>
      ", " <> ToString[NumberForm[xk1, 12]] <> "]" ;
    xk = xk1;
    xk1 = xk2; i++;
    Output = Append[Output, {i, interval, xk2, f[xk2]}];];
  Print[NumberForm[TableForm[Output, TableHeadings ->
    {None, {"i", "interval", "xi", "f[xi]"}}, 8]];
  Print[" Root after ", n, " iterations ",
    NumberForm[xk2, 8]];
  Print[" Function value at approximated root, f[xi]= ",
    NumberForm[f[xk2], 8]];]
g[x_] := x^3 - 5 x + 1;
Plot[g[x], {x, -4, 4}]
Secant[0, 1, 6, g]
